on windows 8 I am using Intuit quickbooks enterprise solutions version 11.0 on windows 8. My localhost server is Ubuntu 12.04. When I upload any data into the quickbooks, it says that the file's size exceeds the max upload size. I have found some error logs from quickbooks server, but I dont know what they mean 2014-03-11 12:11:01 [Warning] File 'application/x-quickbooks-data/bin/quickbooks-pdb.log' was accidentally created with 'w' as the current umask, which is not suitable for operating on filenames. 2014-03-11 12:11:01 [Warning] File 'application/x-quickbooks-data/bin/quickbooks-pdb.log' will be removed when the next error or incomplete error occurs. 2014-03-11 12:11:01 [Warning] File 'application/x-quickbooks-data/bin/quickbooks-pdb.log' was created as an archive, not a directory, and cannot be created as an archive. I tried to chmod 777 but it did not work. Could you tell me how to fix it? Thank you in advance. A: The "umask" is a mask that is used to set the permissions on a file after it is created. For example, if you create a file in Ubuntu, it is set to only allow read and write to the current user with a permission of 'rw-rw-r--' If you want to share your file with the rest of the world, you can either specify a

different umask with the chmod command, or you can change the ownership of the file so that it is owned by root:root (ie. the other users) chmod 0766 Change the ownership with this command: sudo chown root:root myfile You can find the umask (its value should be 066) with: ls -l /var/www/myfile If you are uploading a file from Windows, it should be owned by root:root already. You can do this with: This will work if you have root privileges on the Ubuntu machine. If you don't have root privileges, you will need to specify the 82157476af
